L11 ANSWER 5 OF 5 HCAPLUS COPYRIGHT 2002 ACS

The kanamycin [8063-07-8]-resistance gene aphA of the streptococcal plasmid pJHl was cloned into a shuttle vector. Full expression of aphA was obtained in E. coli and B. subtilis. The starting point for aphA transcription, as detd. by S1 nuclease mapping, was located 340 base pairs upstream from the ATG translational initiator codon. The sequence of the promoter consists of the hexanucleotides TTGACA and TATCTT, with a spacing of 17 base pairs. The stability profile of a 600-base-pair DNA fragment contg. the aphA promoter and the translational initiation site indicated that, as already reported for E. coli, both structures are located in domains of weak stability.
